

TITLE

PARALLEL CHROMOSOMAL STACKING OF TRAITS IN
BACTERIAL

ABSTRACT OF THE DISCLOSURE

5 The invention describes a method for the stacking of traits in a
recombination proficient host using a phage transduction system. The
method makes use of a nucleic acid integration cassette that has
homology to a specific site on a host chromosome for the insertion of
genetic elements and the stacking of traits. Repetition of the method
10 results in the stacking of traits on a single genetic element.
